

Commodity hardware is manufactured by multiple vendors and based on open standards. There are few differences between the offerings from each vendor and thus increases competition and lowers the chance of vendor lock-in.

- Benefits:
- Lower cost hardware with lower running costs
 - Business agility through ‘self service’ elastic computing and eventually utility computing
 - Same hardware used in all Global locations
 - Guaranteed reuse of standards
 - One generic reference architecture (Global)
 - Vendor competition
 - Unified hardware engineering team
 - Unified Support Teams

In Scope
All Platforms & Technologies in All Regions (NA, EAME, SA & APAC)

Not in Scope
Existing AS400 or Legacy Applications

Commodity Hardware Roadmap

ISSUES WITH CURRENT SITUATION

	ISSUE	IMPACT
1	Multiple hardware and OS platforms being supported. Strategically this gives no business or IT benefit for in house applications	Multiple resources performing same tasks on different platforms, multiple costs, support etc
2	Vertical scaling hardware options force silo based projects (Vom etc) Migration to more powerful servers only option for scaling.	Dedicated and expensive resource required to manage proprietary stack, High cost to scale. No vendor competition resulting in lock-in. No elastic compute possibilities
3	Multiple Virtualization platforms in use. No real benefit to AGCO Business or IT Strategy	Silo based virtualization, no leveraging of entire compute landscape, Limits Global Architecture Standards.
4	Multiple IT Vendors & Resources managing hosting environments	High costs to support and maintain multiple IT Systems. High cost of resources.
5	Proprietary hardware stacks are complex and time consuming to install and configure.	Business agility impacted by slow and costly implementation of proprietary hardware stacks.

	CRITERION	EA PRINCIPLE	EVAL
A	Create a Global focused hardware stack for both Data and Application platforms be distributed and reused at Hosted Datacenters, Plants, Suppliers and Dealers.	STANDARDISATION	1
B	Implement standardised Virtualization layer to enable ‘cloud’ architecture with ‘self service’ elastic compute scaling for projects and business agility.	CUSTOMER FIRST	3
C	Create platform they can be managed and supported by single group of IT Resources. Reduce complexity of server support landscape.	REDUCE WASTE, INCREASE QUALITY	2
D	Allow for vendor choice at all levels, avoiding vendor controlled upgrades.	AVOID VENDOR LOCK-IN	2

Year 0-1 Architecture

Year 0-1 Activities

LABEL	ACTION	REASON	CRITERIA	RESPONSIBLE
1	Start all new projects on new stack. Declare AIX, Solaris, DB2 & Oracle as containment.	Halt extension of legacy platforms. Start to build environment.	ALL	ALL
2	Standardise on shared components in stack	Reduce costs, increase agility and leverage existing skills. Start skill share also.	A,B,D	EA, INFRA, APP TEAMS
3	Define Application Architecture strategy for development teams.	Start to build application to take advantage of platform	A,D	EA, APP TEAMS
4	Declare Application and Database Platform Strategies	Identify new platforms for business focused and Global focused architecture	C	EA

Evaluation against vision

CRITERIA	EVALUATION	DETAILS
A	1 → 3	New Implementations on Commodity hardware, contain heterogeneous stack
B	1 → 3	We have Virtualization strategy in place, Cloud Architecture TBD
C	2 → 6	IT Resources groups in place, consolidate teams to support commodity hardware
D	1 → 6	Deploy Applications that are platform agnostic based on open standards.

Year 1-3 Architecture

Year 1-3 Activities

LABEL	ACTION	REASON	CRITERIA	RESPONSIBLE
5	Study & Plan DB2 To MSSQL Migration	Standardize.	B	INFRA, APP TEAMS
6	Study & Plan Oracle To MSSQL Migration	Standardize.	B	INFRA, APP TEAMS
7	Educate Resources to support Standard Technologies	Take Advantage Of Standards.	A,C	INFRA, APP TEAMS
8	Research, Evaluate & Implement Cloud Technologies	Technology Roadmap	ALL	EA, INFRA, APP TEAMS
